The workshop familiarizes students with a set of selected core concepts of public policy analysis, an interdisciplinary approach that can be strategic to go deeper into the understanding of contemporary urban issues, and the decision-making processes that seek to tackle them. It aims at providing students with insights into such a theoretical and methodological approach, suggesting how to frame research projects that use policy analysis as a way to investigate urban and territorial issues and their governance.

Through different activities to be carried out both individually and in small groups (the viewing and discussion of a movie, the reading and interpretation of a paper, the reflection on the ongoing Ph.D. research), students will be encouraged to explore:

- i) how *public problems* are collectively defined (and constantly re-defined) in decision-making processes;
- ii) who are the main *actors* of a policy/planning process, their stakes, resources, and networks of interaction;
- iii) the different *models* and *forms of rationality* used in policy-making (rational-comprehensive models, incrementalism, garbage-can models, etc.);
- iv) the intentional and/or non-intentional *outcomes* of a policy.
